

Nexus — How It Works

Visual overview of the three core systems that power Nexus, and how they connect.

1. Tools Engine & Orchestrator

When an engineer asks a question, the Orchestrator figures out *what to do* and the Tools Engine *does it* — looping up to 15 times until the answer is complete.

Key idea: The Orchestrator doesn't just call one tool — it *reasons* about which tools to chain together, reviews intermediate results, and keeps going until the question is fully answered.

2. How Learning Works

Nexus gets smarter every time it's used. Knowledge flows in from team contributions *and* from conversations — building a living memory that the whole team benefits from.

Key idea: Nexus doesn't just answer from static docs — it learns from every interaction. The more your team uses it, the smarter it gets.

3. How Skills Work

A Skill is a markdown file that tells Nexus *who to be*, *how to think*, and *what tools to use*. Switching skills completely changes Nexus's behaviour — like giving it a new role.

Key idea: Skills are just markdown. Any engineer can create one — no code, no deploy. Your team's best practices become living, enforceable AI behaviour.

4. Combined — The Full Picture

How all three systems connect: Skills shape *who* Nexus is, the Orchestrator & Tools Engine handle *what* it does, and Learning makes it *smarter over time*.

The full loop: An engineer picks a Skill (shaping Nexus's persona), asks a question, the Orchestrator plans and calls tools, checks the Knowledge Base, asks for approval when needed, delivers the answer — and records what it learned for next time. Every cycle makes Nexus smarter.
